CT BRAIN – PLAIN

Patient Id: 700043	**Study Date & Time:** 07/11/2026 15:20
Patient Name: MD KAIF	
Age / Sex: -/Male	**Report Submit:** 09/11/2026 11:20

Technique

Non-contrast CT scan of the orbits performed with multiplanar reformatted images.

REPORT

Both ocular globes are normal in size, shape and attenuation.

Bilateral extraocular muscles are normal in size and configuration.

Bilateral intraconal and extraconal fat planes are preserved.

Bilateral optic nerves and optic nerve sheaths appear unremarkable.

No evidence of an obvious intraorbital soft tissue mass or focal collection.

No significant proptosis is seen.

Bilateral orbital walls are intact, without evidence of osseous erosion or destruction.

Mild mucoperiosteal thickening is noted in the left maxillary sinus.

Rest of the visualized paranasal sinuses are unremarkable.

Impression

Diffuse left periorbital soft tissue edema.

Few linear hyperdense foci in the soft tissues anterior to the left orbit – suspicious for possible foreign bodies. Correlation with clinical examination is recommended.

No obvious intraorbital extension or focal orbital collection.

Mild left maxillary sinus mucosal thickening.

ADVICE

Clinical Correlation for further evaluation
