Patient Name: SANTOSH KUMAR	**Study Date:** 2026-11-07T16:33:04
Referring Doctor:	

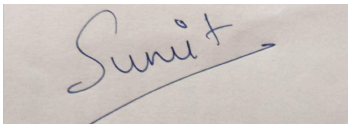

REPORT

Bilateral fairly extensive, ill-defined heterogeneous air-space opacities, predominantly involving the perihilar and upper lung zones.
Bilateral perihilar vascular and interstitial prominence.
Patchy air-space opacities are also noted in the mid and lower lung zones, more conspicuous on the left.
Cardiac silhouette appears enlarged.
Bilateral costophrenic angles are partially obscured; small bilateral pleural effusions cannot be excluded.
No evidence of pneumothorax.
Visualized bony thoracic cage shows no obvious acute abnormality.

IMPRESSION

Bilateral multifocal air-space opacities with prominent perihilar distribution.
Cardiomegaly with bilateral pulmonary opacities, raising the possibility of cardiogenic pulmonary edema (congestive cardiac failure).

ADVICE
Clinical Correlation for further evaluation
